

# Psoriatic Arthritis Treatment Guidance for Biologic Drugs

## INITIATING a Biologic requires

Active and progressive PsA

- 3+ tender joints
- AND 3+ swollen joints
- AND inadequate response to 2+ standard DMARDs
- The most cost effective drug must be used first

## CONTINUATION of a Biologic requires

Adequate PsARC response requires improvement of at least **TWO** criteria at the end of the initiation period

- **ONE** of these must be **EITHER** joint swelling **OR** joint tenderness
- No worsening of any of the other PsARC criteria
- Patients with an PASI 75 (skin) response but inadequate PsARC (joint) response must be reviewed by a dermatologist for treatment to continue

IL-23 and IL-17 target different sites within the same pathway

## Funding

Must be applied for via Blueteq for all Shropshire or T+W patients

- Initial funding is for initiation period detailed below
- Continuation funding provides continuous approval until the drug is ineffective / not tolerated

### Special Groups for Consideration

Elderly / Frail – consider Apremilast – minimal immunosuppressive effect / infection risk None plaque psoriasis – biologics less effective – consider dermatology referral

## Sequencing

- 1<sup>st</sup> line Adalimumab biosimilar or Secukinumab if a TNF is contraindicated.
- 2<sup>nd</sup> line Secukinumab
- **3**<sup>rd</sup> **line** Tofacitinib + Methotrexate / if predominantly skin disease consider referral to dermatology
- 4<sup>th</sup> line+ Any alternative licenced treatment

#### PsARC Criteria

- Number of swollen joints
- Number of tender joints
- Patient global assessment
- Physician global assessment

Target	Drug	Licenced for Monotherapy	NICE guidance Idrug	Initiation Period	Comments / Conditions
	Adalimumab	$\checkmark$	TA199	12 weeks	
TNF $\alpha$	Etanercept	V	TA199	12 weeks	NOT routinely used for skin psoriasis. Loss of efficacy
	Certolizumab	V	TA445	12 weeks	NOT licenced for skin psoriasis
	Golimumab	V	TA220	12 weeks	
	Infliximab	×	TA199	12 weeks	With Methotrexate ONLY unless intolerance or contraindication
IL-23	Ustekinumab	V	TA340	24 weeks	Higher dose available for overweight patients (same cost)
11 17	Secukinumab	$\checkmark$	TA445	12 weeks	
IL-17	Ixekizumab	V	TA537 16 weeks		
JAK inhibitor	Tofacitinib	×	TA543	12 weeks	With Methotrexate ONLY

PDE4 inhibitor	Apremilast 🛛 🖸	☑ TA433	16 weeks
